

MODULE 03 PART 1

JOSEPH A. PEÑEVERDE

Answer the following question/statements by providing a short explanation (1 to 2 sentences). Each answer is worth five (5) points.

A. Is an operating system a hardware or software?

- Software, because it is not tangible but also a part of a computer.

B. In simplest terms possible, define what process scheduling is.

- The process scheduling is the pastime of the system supervisor that handles the elimination of the going for walks system from the CPU and the choice of another.

C. Differentiate between process manager and memory manager.

- The process manager manages the processes in the system and is responsible for CPU sharing. The memory manager manages the system's memory, is responsible for allocating and freeing memory, and managing virtual memory. Finally, there is no file system, so there is no file manager.
